

Error Handling

ErrorType

Description: Type of the atom which contains an error.

Type: Type

Error

Description: Constructs an error atom, indicating a problem during evaluation.

Parameters:

- Atom: The atom where the error occurred.
- Message: An error message, such as `BadType` or `IncorrectNumberOfArguments`.

Return: An error atom.

Example:

```
(Error (add "a" 2) BadType)
```

if-error

Description: Checks if an atom is an error. Returns one value if it is, and another if it is not.

Parameters:

- Atom: The atom to check.
- Then: Value to return if the atom is an error.
- Else: Value to return otherwise.

Return: Either the `Then` or `Else` argument.

  latest ▼

Example:

```
!(if-error (Error 5 BadType) "Error!" "No error") ; Returns "Error!"
```

return-on-error

Description: Returns the first argument if it is an Empty or an error. Returns the second argument otherwise.

Parameters:

- Atom: Atom to check.
- Then: Atom for further evaluation if the first argument is not an Error or Empty.

Return: Return previous result if it is an error or Empty or continue evaluation.

Example:

```
!(return-on-error (Error 5 BadType) 6) ; Returns (Error 5 BadType)  
!(return-on-error 5 6) ; Returns 6
```
